

PARTICIPATION IN BASKETBALL BY AUSTRALIAN CHILDREN 2003 – 2012

Report prepared by the Australian Sports Commission

Participation Data for Australian Children 5-14 Year Olds

This report presents data from the *Children's Participation in Cultural* & *Leisure Activities Survey (CPCLAS)* which was administered by the Australian Bureau of Statistics (ABS) in 2003, 2006, 2009 and 2012.

The *CPCLAS* collected information about participation in *organised sport outside* of school hours for Australian 5-14 year olds as recalled by their parents.

More details on the *CPCLAS* can be found via ABS cat. no. 4901.0 or the following link:

http://www.abs.gov.au/AUSSTATS/abs@.nsf/Lookup/4901.0Main+Features1Apr %202012?OpenDocument

This report has been prepared by the Australian Sports Commission (ASC) and includes some data that has not been presented in previous ABS *CPCLAS* publications. The ASC purchased custom data for select sports through the ABS Sports Unit.

The Children's Participation in Cultural & Leisure Activities Survey

The Children's Participation in Cultural & Leisure Activities Survey asked parents:

Which sports has [Child name] played or trained for outside of school hours since this time last year?

In each year the survey was administered, a number of parents responded:

^{*} In this report, the definition of basketball includes indoor and/or outdoor basketball.

Explanatory notes for interpreting the Children's Participation Data

Data from the *CPCLAS* should not be directly compared with results from other sport participation surveys, such as the *Exercise Recreation And Sport Survey (ERASS)* or the *ABS adult sport participation surveys*, without considering the difference in methodology, scope and years.

It should be noted that the **CPCLAS** data:

- Is based upon a different data collection process to the ERASS adults' data
- Is not collected in the same years as the ERASS and ABS adults' data
- Reflects <u>parent responses</u>, while the ERASS and ABS adults' data reflects participant responses
- Reflects participation <u>outside of school hours</u> only, while the ERASS and ABS adults' data also included measures of total participation
- Reflects <u>organised participation only</u>, while information on non-organised participation data was also collected for the ERASS and ABS adults
- Reports different participation frequency categories to the ERASS adults data (e.g. Regular participation for the children's data is defined as 27 times or more a year, while for the adults data is defined as 26 times or more a year)

How to interpret the Children's Participation Data

Some of the data in this report has not been publically released by the ABS. The ASC sourced custom data tables from the ABS containing information relevant for sports. Please note that the ASC did not have access to the raw data. As the ABS reported the total survey sample size (sample size in 2003 = 8,900; sample size in 2006 = 8,682; sample size in 2009 = 5,825; sample size in 2012 = 7,300), it was possible to compare the proportion of Australian children participating in a sport across the four time periods with significance testing. The ABS, however, did not report the sample sizes for the demographic (e.g. age or gender) categories, so it was not possible to conduct significance tests on demographic subgroups. As such, the interpretation of data relating to the demographic subgroups in this report is indicative only.

The ABS does not publically release data with high Relative Standard Errors (RSEs). It is important to note that all the basketball data presented in this report was associated with acceptable RSEs. For further information* related to RSEs associated with the data please refer to ABS cat. no. 4901.0.

Please note that scales may differ between charts.

Australian children's population (5–14 year olds) by year from ABS population estimates:

 2003: 2,647,500
 2006: 2,664,700

 2009: 2,722,500
 2012: 2,786,100

Participation frequency definitions:

- Annual defined as participating in a given sport at least once a year
- Regular defined as participating in a given sport at least 27 times a year
- Non-regular defined as participating in a given sport at least once but less than 27 times a year

*http://www.abs.gov.au/AUSSTATS/abs@.nsf/Latestproducts/4901.0Technical%20Note1Apr%202012?opendocument&tabname=Notes&prodno=4901.0&issue=Apr%202012&num=&view=

Summary of Trends

Summary of General Trends in Children's Participation Among 21 Selected Sports

Between 2003 and 2012 there was a <u>significant increase</u> in children's organised participation in the following sports:

- *Gymnastics* and *rugby union* had a significant increase in annual, regular and non-regular participation rates.
- Rugby union had a significant increase in annual and non-regular participation rates.
- Touch football and football had a significant increase in the non-regular participation rate.

Between 2003 and 2012 there was a <u>significant decrease</u> in children's organised participation in the following sports:

- Hockey had a significant decrease in annual, regular and non-regular participation rates.
- Netball, tennis and softball had a significant decrease in annual and regular participation rates.
- Athletics had a significant decrease in the annual participation rate.
- Cricket, touch football and golf had a significant decrease in the regular participation rate.

For information on general trends in children's organised participation across sports please refer to the following ABS reports:

- 1. http://www.ausport.gov.au/ data/assets/pdf file/0011/276914/ABS Childrens participation in organised 2003 2006.pdf

Summary of General Trends in Children's Basketball Participation

Organised basketball participation

Between 2003 and 2012:

- The ABS estimation of the number of children annually participating in organised basketball varied around 176,000 (in 2006) and 220,000 (in 2012).
- The ABS estimation of the percentage of Australian children annually participating in organised basketball varied between 6.6% (in 2006) and 7.9% (in 2012).

A comparison of 2003 and 2012 revealed no significant difference in the annual, regular and non-regular participation rates for children's organised basketball.

Comparison of regular v. non-regular organised basketball participation

For all four time periods, the regular participation rate for children's organised basketball was statistically significantly higher than the non-regular participation rate.

Demographic analysis of organised basketball participation

Between 2003 and 2012, the ABS estimated that there were more boys than girls participating in organised basketball annually and regularly. The ratio of girls to boys playing organised basketball was relatively consistent throughout 2003 to 2012.

Between 2003 and 2012, the ABS estimated that over three quarters of annual organised basketball participants were 9-14 years of age.

Organised* Participation in Basketball^

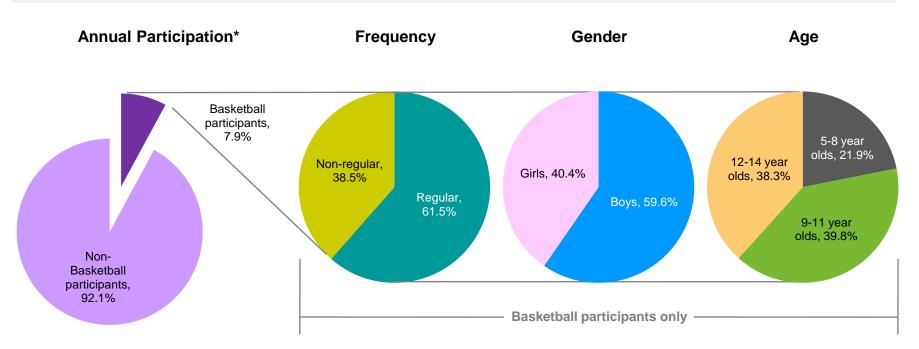

^{*} The CPCLAS refers to "organised sport" as a sport which is played or trained for outside of school hours and is organised by a school, club or association

[^] Includes indoor and outdoor basketball.

Current Participation Status (2012)

Interpretive Notes

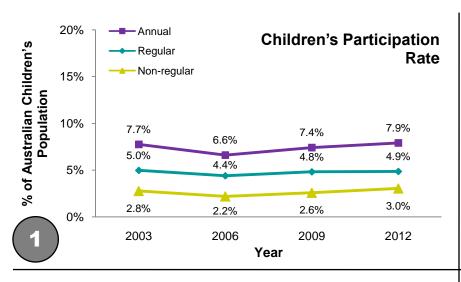

- 7.9% of the Australian children's population participated in organised basketball at least once in 2012.
- There was a statistically significant higher proportion of regular organised basketball participants (61.5%) than non-regular participants (38.5%).
- Three in five (59.6%) annual organised basketball participants were boys*.
- Over three quarters (78.1%) of annual organised basketball participants were aged 9-14 years*.

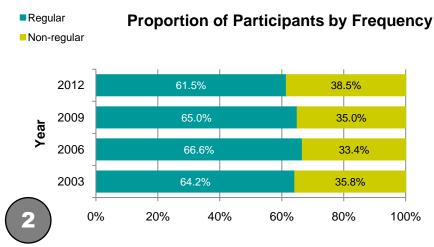

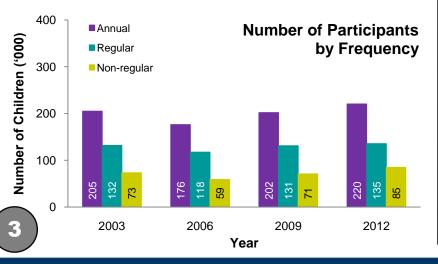

^{*}As the ABS did not report the survey sample sizes for the demographic (e.g. age or gender) categories it was not possible to conduct a significance test on the demographic subgroups **Based on the 2012 ABS population estimate for Australian 5-14 year olds

A one sample Difference in Proportions T-Test at 95% confidence level was used to compare regular and non-regular participation rates

2003 – 2012 Participation by Frequency

Interpretive Notes

Between 2003 and 2012, the ABS estimation of the number of children annually participating in organised basketball varied around 176,000 (in 2006) and 220,000 (in 2012).

Between 2003 and 2012, the ABS estimation of the percentage of Australian children annually participating in organised basketball varied between 6.6% (in 2006) and 7.9% (in 2012).

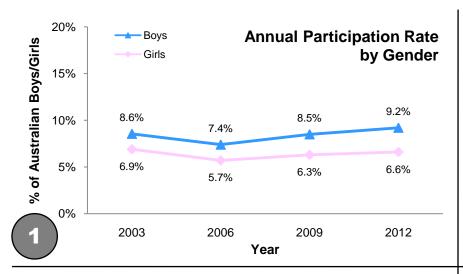

A comparison of 2003 and 2012 revealed no significant difference in the annual, regular and non-regular participation rates for children's organised basketball.

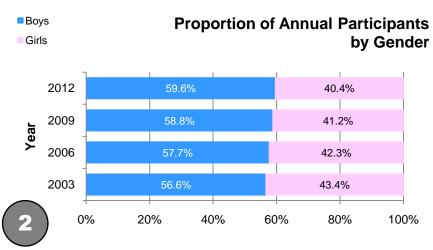

For all four time periods, the regular participation rate for children's organised basketball was statistically significantly higher than the non-regular participation rate.

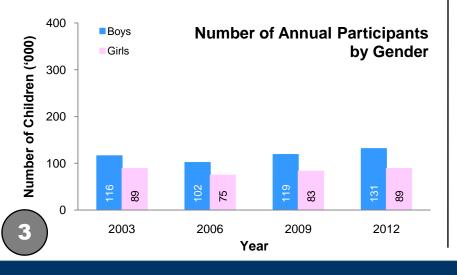

Note: A two sample Difference in Proportions T-Test at 95% confidence level was used to compare the percentage of Australian 5-14 year olds participating across the four time periods. A one sample Difference in Proportions T-Test at 95% confidence level was used to compare regular and non-regular participation rates.

Annual Participation Demographic Analysis

Annual Participation by Gender

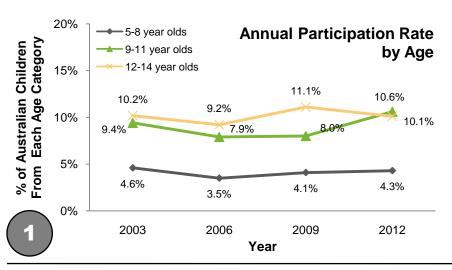

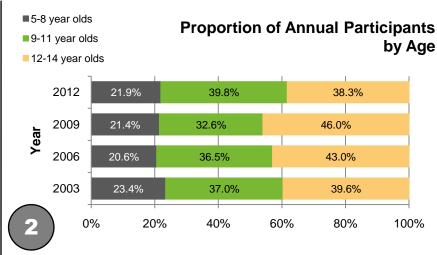

Interpretive Notes

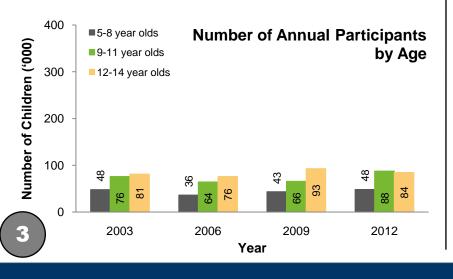

The data presented on this slide appears to indicate the following:

- Between 2003 to 2012, the ABS estimated that there were more boys than girls participating in organised basketball at least once a year.
- The proportion of boys to girls playing organised basketball at least once a year was relatively consistent throughout the four time periods.

Annual Participation by Age

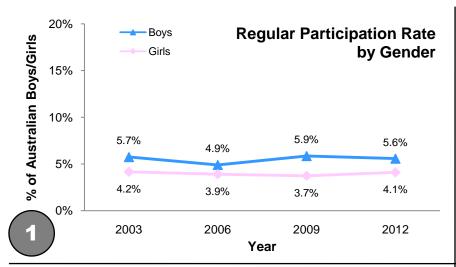

Interpretive Notes

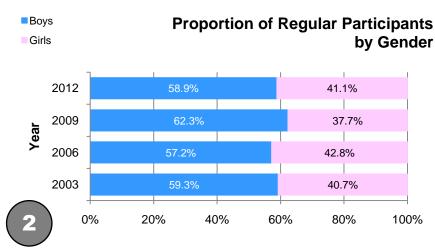

The data presented on this slide appears to indicate the following:

 Between 2003 and 2012 the ABS estimated that over three quarters of annual organised basketball participants were 9-14 years of age.

Regular Participation Demographic Analysis

Regular Participation by Gender

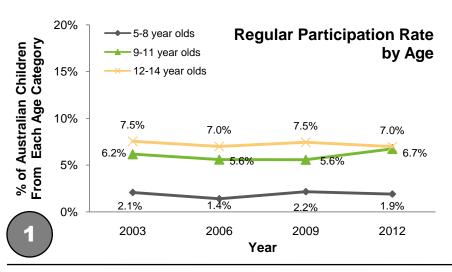

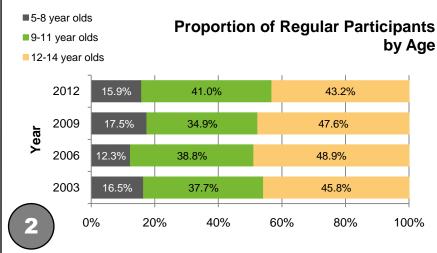

Interpretive Notes

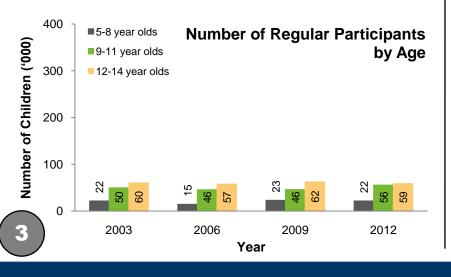

The data presented on this slide appears to indicate the following:

- Between 2003 to 2012 there were more boys than girls participating in organised basketball regularly.
- The proportion of boys to girls participating regularly in organised basketball was similar to the annual participation gender ratios.

Regular Participation by Age

Interpretive Notes

The data presented on this slide appears to indicate the following:

 The proportion of regular organised basketball participants from each age category was similar to annual organised basketball participation age ratios, although compared to the annual participation ratios there was a higher proportion of12-14 year olds participating regularly.

Sport Comparison

Ranking of Selected Sports According to Annual Participation

2012 Ranking	SPORT	2003 Ranking	1
1	Swimming	1	-
2	Football	2	-
3	Australian Football	6	☆ 3
4	Netball	3	• 1
5	Basketball	5	-
6	Tennis	4	4 2
7	Gymnastics	9	1 2
8	Cricket	7	4 1
9	Rugby League	10	<u></u> 1
10	Track and Field Athletics	8	4 2
11	Rugby Union	14	☆ 3

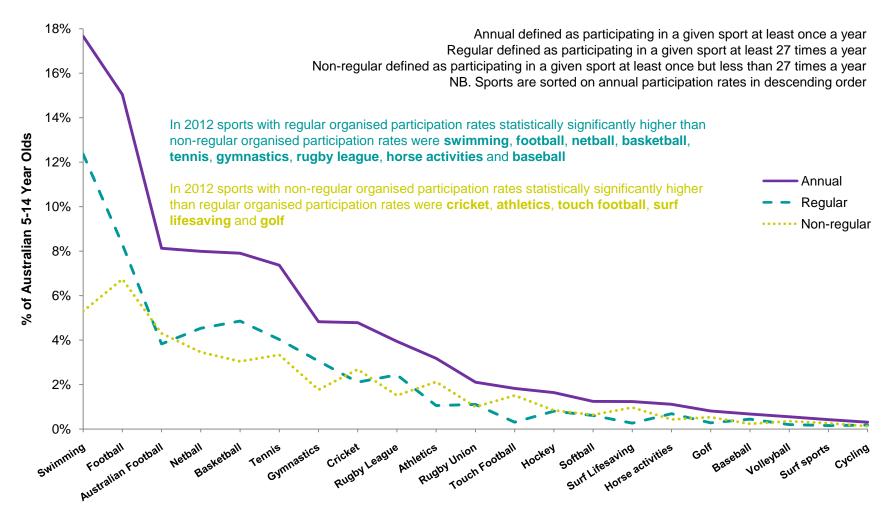

2012 Ranking	SPORT	2003 Ranking	1
12	Touch Football	13	1
13	Hockey	11	₽ 2
14	Softball	12	4 2
